Evaluate a Patient in Labor

Marie Manikin is a 24 year old primigravida at 39 4/7 weeks gestational age. She arrived in L&D today at 0300 with SROM and contractions. On admission, her cervix was 3 cm/50%/-1.

She was rechecked at 0700 and found to be 5/C/0 station. She received an epidural at that time. It is now 1100 and she is asking for a redose of her epidural.

Go in and introduce yourself to Marie, review her intrapartum records, examine her, and write a progress note, documenting your findings and recommendations, if any.

No faculty will be present for this evaluation, and the manikin will not speak. But your interaction is being video recorded for later review.

Progress Note:
